If the edge is negative ( b < q / p {displaystyle b&lt;q/p} ) the formula gi
ves a negative result, indicating that the gambler should take the other side of
 the bet.
 Therefore, the expected geometric growth rate r r is:
                                         .
1 [ 2 ( 1
                                                                                                                                              K)(2p+)K[2()TjT*B
                                                                    p) [ ] N
                                                                                                          KW (N
K(2p+)K
KW-(N-K)(2p+Delta)^{K}[2(1-p)-Delta]^{N-K-1}W}
\uparrow k = B k i B i = D 1 + Q k, {displaystyle eta _{k}={ rac {B_{k}}}{sum _{k}}
iB_{i}={ rac {D}{1+Q_{k}}},
 According to the Kelly criterion one should maximize
Thus we reduce the optimization problem to quadratic programming and the unconst
rained solution is
